Description

Premium & Durable Slide

The D Series Freestanding Stainless Steel Playground Slides offer a premium, durable solution for playgrounds requiring long-lasting performance and safety. Available for deck heights from 3 to 10 feet, this series is ideal for schools, parks, churches, and commercial environments.

Each slide features a solid welded stainless steel bedway, eliminating the need for screws along the sliding surface. This design removes common failure points such as rusted fasteners and pinch hazards found in lower-quality slides, resulting in a safer and more structurally sound product.

Unlike plastic alternatives, these stainless steel playground slides stay cooler in direct sunlight, averaging up to 8° lower surface temperatures. They also resist UV fading, eliminate cold-weather cracking, and reduce static electricity—making them a better choice for long-term outdoor use and accessibility.

The freestanding design allows for flexible installation without requiring a full playground structure, making these slides ideal for compact spaces or standalone installations. Each unit is engineered to meet ASTM and CPSC safety standards, ensuring reliable performance in commercial settings.
