## Product Image

## Description

### Durable & Flexible Product

The Stainless Steel Straight Slide Series with Square Rails delivers unmatched durability, flexibility, and performance for playgrounds of all sizes. Designed for deck heights from 3 to 26 feet, this series includes single wide, double wide, and embankment configurations to fit virtually any project.

Each slide features a welded stainless steel bedway, eliminating the need for screws along the sliding surface. This improves structural integrity while removing common failure points like rusted fasteners and pinch hazards found in lower-quality slides.

Available with powder-coated or stainless steel square side rails (4" or 6"), these slides can be customized for both appearance and performance. The result is a clean, modern look paired with long-lasting, low-maintenance materials.

Unlike plastic alternatives, stainless steel slides stay cooler in direct sunlight, resist UV fading, and eliminate cold-weather cracking. They also reduce static electricity buildup and offer

superior resistance to vandalism such as graffiti or burn damage.

Whether you're designing a school playground, park installation, hillside slide, or custom architectural feature, this series provides the flexibility and strength needed for long-term performance.
