Description

Long-term Performance

The Double Stainless Steel Straight Playground Slide Series is built for projects that need greater capacity, premium durability, and long-term outdoor performance. Designed for deck heights from 3 to 26 feet, this series is available in multiple configurations with 4-inch or 6-inch side rails in either powder-coated steel or stainless steel.

Each double slide features a welded stainless steel bedway for improved structural integrity and a smoother, safer sliding surface. By eliminating exposed screws along the chute, these slides reduce pinch points, rust issues, and the maintenance problems often found in lower-grade alternatives.

These double wide stainless steel slides are ideal for schools, parks, camps, churches, and commercial playgrounds where durability and rider throughput matter. For elevations over 10 feet, these models are intended for embankment slide applications, and enclosed tube slide

configurations may be a better fit where additional containment is preferred.

Compared to plastic, stainless steel offers several long-term advantages. It resists UV fading, avoids cold-weather cracking, reduces static buildup, and stands up better to vandalism, graffiti, and heavy use. It also maintains cooler surface temperatures than many expect, making it a strong option for demanding outdoor environments.
