Description

Elevate Your Play

Upgrade your playground with this 6 ft deck height aluminum spiral slide, designed to deliver exciting performance while maintaining a compact footprint. Known as a spiral slide, twisty slide, or helix slide, this design combines high visual appeal with efficient use of space.

Built from one-piece welded aluminum, this slide eliminates weak joints and mechanical connections found in sectional designs. The unitized construction enhances structural integrity, reduces maintenance, and improves long-term reliability in both residential and commercial environments.

The spiral layout allows for taller slide installations in tighter spaces, making it ideal for schools, parks, churches, and backyard play systems. High outer walls and deep spiral geometry help keep riders safely contained throughout the descent.

Unlike plastic slides, this metal spiral slide remains cooler in direct sunlight, resists UV fading, and eliminates cracking in cold weather. It also reduces static buildup and offers strong resistance to vandalism, including graffiti and surface damage.

This model requires a minimum installation space of approximately 70–72 inches in diameter, making it a great solution where space planning is critical.
