Description

High Performance Play

Create a bold playground centerpiece with this 8 ft deck height aluminum spiral slide, designed for exciting performance while maintaining efficient use of space. This open spiral slide combines visual impact with a controlled, safe descent for riders.

Constructed from one-piece welded aluminum, this slide eliminates the weak points commonly found in sectional designs. The unitized construction improves structural strength, reduces maintenance, and ensures long-term reliability in both residential and commercial playground environments.

The spiral (helix) design allows taller installations in a smaller footprint, making it ideal for schools, parks, churches, and backyard play systems. High outer walls and deep spiral geometry enhance rider safety by keeping users securely within the chute.

Unlike plastic alternatives, this metal spiral slide stays cooler in direct sunlight, resists UV fading, and eliminates cold-weather cracking. It also reduces static electricity buildup and offers superior resistance to vandalism such as graffiti or surface damage.

This model requires a minimum installation space of approximately 70–72 inches in diameter, making it a practical solution for projects where space planning is important.
