Description

High Performaning Slide

Make a bold statement with this 9 ft deck height aluminum spiral slide, designed to deliver a longer, more exciting ride while maintaining a compact footprint. This open spiral (helix) slide is ideal for playgrounds that need both performance and efficient use of space.

Constructed from one-piece welded aluminum, this slide eliminates weak joints and mechanical connections found in sectional designs. The unitized construction enhances structural integrity, reduces maintenance, and ensures long-term durability in demanding environments.

The spiral design allows for taller slide installations without requiring extended run-out space, making it ideal for schools, parks, churches, and backyard play systems. High outer walls and deep spiral geometry help keep riders safely contained throughout the descent.

Compared to plastic slides, this metal spiral slide remains cooler in direct sunlight, resists UV fading, and eliminates cold-weather cracking. It also reduces static electricity buildup and provides superior resistance to vandalism and wear.

This model requires a minimum installation space of approximately 70–72 inches in diameter, making it a practical solution for projects where space is limited but impact is important.
