Description

Elevate Your Play

Designed for higher elevations and longer ride experiences, this 30-inch diameter Aluminum Tube Slide is engineered for 8 ft deck height installations in residential, school, and commercial playground environments.

At this height, safety becomes critical—which is why the fully enclosed tube design provides superior rider containment throughout the entire slide path. This helps prevent falls and ensures a more controlled, confident ride from top to bottom.

Constructed from high-quality aluminum, this slide delivers exceptional durability without the cracking, fading, or overheating commonly associated with plastic slides. It’s built to perform in demanding environments while requiring minimal maintenance.

Installation is straightforward with the included flat mounting plate, allowing secure

attachment to decks, panels, or structures. Optional adapters are available for custom mounting scenarios, including round posts or unique builds.

In addition to playground use, straight tube slides can also function as crawl tunnels or architectural play features, adding flexibility to your design.

Aluminum construction ensures cooler surface temperatures, reduced static buildup, and strong resistance to vandalism—making this slide a reliable long-term investment.
