Description

Versatile Slide Experience

The Aluminum Trough Slide Chute, also known as a half-pipe slide, is a versatile solution designed for both traditional playground decks and large-scale embankment installations.

Supporting elevations from 4 feet up to 26 feet, this slide is ideal for projects ranging from standard playgrounds to hillside and architectural applications. For installations above 10 feet, trough slides are typically used as embankment slides, where the surrounding terrain enhances safety and rider containment.

The open half-pipe design provides a classic sliding experience while maintaining structural simplicity and durability. For higher elevations where additional containment is required, enclosed tube slides may be recommended.

Manufactured from lightweight, high-strength aluminum, this slide offers long-term durability without the cracking, fading, or heat retention associated with plastic alternatives. Its surface remains cooler in direct sunlight, reduces static buildup, and resists vandalism such as graffiti

or burn damage.

Each slide is custom-engineered to match your project’s exact specifications. Whether you're working with a hillside, integrating into architecture, or designing a themed play environment, our team provides full-service support—from concept and engineering to manufacturing and installation.

Available in a wide range of standard and custom powder-coated finishes, this trough slide can be tailored to match any playground theme or design vision.
