Description

Long Term Durability

The Aluminum Spiral Slide for 23 Ft Deck Height is designed for extreme-height installations where engineering, safety, and performance must be carefully planned from the start.

At this level, a slide is no longer a simple playground component—it becomes a custom-designed feature integrated into a larger project.

Constructed as a solid, one-piece welded aluminum unit, this spiral slide eliminates mechanical joints, improving long-term durability and structural integrity. The helical design provides an extended, controlled descent path while maintaining a more compact footprint than straight slides of similar height.

Common uses include:
- Destination playgrounds and public parks

- Resorts and hospitality environments
- Themed attractions and entertainment venues
- Architectural and indoor installations
- Custom residential estates with supervised use

Critical Design Consideration

At 23 ft deck height, slide design must be approached as a project-level engineering decision. In many applications, enclosed tube slides are recommended due to:

- Increased rider containment
- Reduced fall risk
- Better control of speed and rider positioning

Open spiral slides at this height are typically used only when:

- The environment is supervised
- The installation is custom-engineered
- Safety measures are incorporated into the overall design

Our team works directly with you to determine:

- The most appropriate slide type
- Site-specific safety considerations
- Integration with your structure or terrain

Specifications

- Deck Height: 23 feet
- Slide Type: Spiral (Open Bedway)
- Material: Aluminum
- Construction: One-piece welded design
- Minimum Space Requirement: 70–72 inch diameter
- Finish: TGIC polyester powder-coated
- Use: Commercial / architectural / custom residential
